Lesson   **Monday**

Introduction to Programming (/introduction-to-programming) / JavaScript and Web Browsers (/introduction-to-programming/javascript-and-web-browsers) / Business and User Interface Logic

Text   Cheat sheet

Terminology

- **Business logic**: The code responsible for handling the evaluation and manipulation of data; does not require any user interface.

- **User interface logic**: The code responsible for the interaction between the user and the application; handles tasks such as event listening, user input forms, DOM manipulation, display and styling. We haven't learned how to write the actual code for this (except via `window` methods), but we will soon!

Summary

Because they are responsible for entirely separate things, code for business logic and user interface logic should always be separated.
